Building Reports, Dashboards, and Custom Pages (UI Builder)

Job Application Form

1. Aim

To build supporting Reports and a UI Builder Dashboard Page for the existing “Job Application Form” application in Zoho Creator, allowing a recruiter to view, filter, and track submitted job applications, and allowing application trends and department-wise interest to be monitored from a single unified screen.

2. Procedure

2.1 Building the Reports

1. Open Reports in the left sidebar; Zoho Creator auto-generates a grid report from the form. Rename it “All Job Applications”, listing candidate name, email address, current address, contact number, LinkedIn profile, cover letter, and years of experience for every application.

2. Create a second report, group it by the Department field, and name it “product sales” so applications are organized into Software Development, Data Science and Analytics, Product_management, and UI/UX design columns, making it easy to see which departments are receiving the most applications.

3. Create a third report, “Job Application Summary”, that consolidates candidate name, email address, current address, contact number, LinkedIn profile, cover letter, and years of experience into a single scrollable table for the recruiter to review at a glance.

2.2 Building the Dashboard Page (UI Builder)

1. Go to Pages under UI Builder → click New Page → choose Blank Page → name it “dashboard.”

2. Add a summary tile titled “application count” showing the total number of job applications received, along with an “Update Details” button.

3. Add a Chart Component plotting Years_of_experience against Employment_Type (Full-Time, Part-Time, Contract / Freelance) as a bar chart, so the recruiter can see experience levels across job types.

4. Add a pie chart showing the number of applications received on each date, so submission trends can be tracked over time.

5. Add a “Course Completion by Department” component listing UI/UX design, Product_management, and Data Science and analytics counts, so the recruiter can gauge department-wise interest at a glance.

6. Drag in an “All Job Applications” button/link so every candidate record is reachable directly from the dashboard.

7. Arrange the layout top to bottom: application count and Update Details → experience bar chart and date-wise pie chart → Course Completion by Department → All Job Applications link.

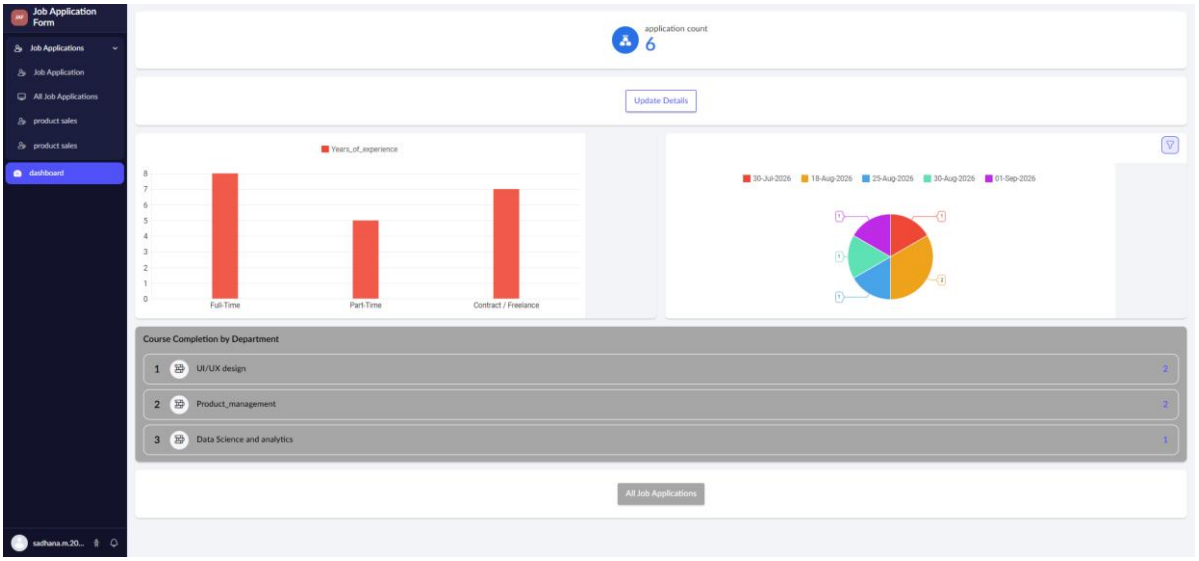

8. Preview the page to confirm the report loads with the correct counts, both charts render correctly, and each report link opens the right view.

9. Check Form, Report, and Page permissions under Settings for each user role, ensuring the intended roles have View/Add access.

10. Publish the page and, if required, set “dashboard” as the default landing page under App Settings → Pages.

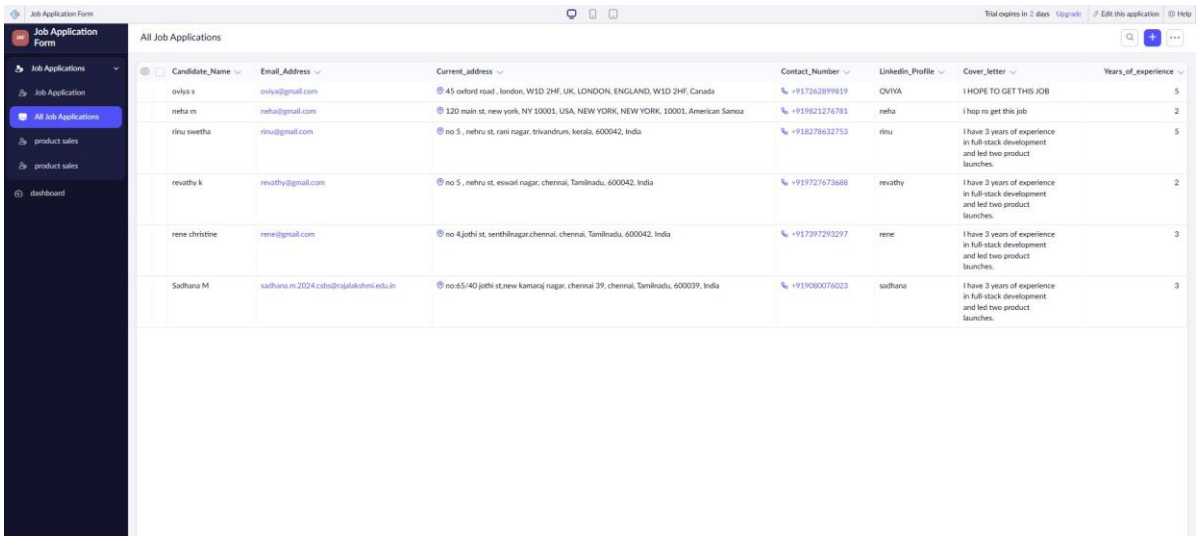

241401095

3. Output

dashboard – application count, employment-type & date-wise charts, and Course Completion by Department

241401095

All Job Applications – consolidated view of candidate name, email, address, contact, LinkedIn, cover letter, and years of experience

4. Result

An “All Job Applications” report, a “product sales” report grouped by department, and a consolidated “dashboard” page were built using UI Builder for the existing Job Application Form application. This enables the recruiter to view application patterns at a glance, track candidate experience and interest by department, and review every application from a single unified screen, ensuring each job application is captured as a structured, trackable digital record before shortlisting.
